## Creating "Sandwich" Inclusions

For the stones with inclusions, the system now supports the ability to increase in some cases the mass of the solution by specifying that ***some part*** of inclusion can be included in the future solution. This can be done by marking an inclusion as multi-part ("Sandwich").

For a future "sandwich" inclusion you can specify:

- Desired structure: **Slices** (Recommended) or **Shell**.
- Desired clarity of the external layer compared to the internal layer clarity.
- Optionally - Extra (intermediate) layer presence and clarity.

To make an inclusion "sandwich":

1. In the **Recut** mode, access the **Inclusions** panel.
2. From the menu for your inclusion, select **Make Sandwich**. The **Creating "Sandwich" Inclusion** dialog is displayed.
3. Specify the "sandwich" options and then click **OK**. In the **Inclusions** panel, your inclusion will be slit into the corresponding parts.
4. Run optimization with your new inclusions.

You can find some details in the video below:

Video   Increasing Mass - Using Sandwich Inclusions				
Published:	2020, October 16	Last Updated:	2020, October 16	v.2.0

Your browser does not support the HTML5 video element

Video summary:

- Sandwich Inclusion function allows increasing the mass of a solution without a decrease of its clarity
- It splits an inclusion into layers
- The external layer (shell) can be included in the solution thus it becomes bigger, increases the mass
- The internal (core) continues to limit the solution boundaries, keeps the Clarity high
- Big inclusions outside but close to the surface give the chance for using "Sandwich"
- Appropriate inclusions can be searched using QC Panel

Video keywords: clarity, inclusion, sandwich, QC panel

## Scanning - Applying Facet Marking from Sample

Now during [scanning](#) using a loaded sample cutting, a facet marking from this sample is automatically transferred to the created 3D model. This provides an effective way of getting the correct facet classification (marking) for your model and creating the ***appropriate reports*** .

For example:

Auto Marking	Marking of Sample and Resulting Marking (identical)
--------------	---

Facets	Element	*	Tier	Type	SubType	No.	Color	Alias

Facets' angles

- You can **view the facet marking** of your sample (DMC format). Do one of the following:
  - As you select your sample in **Cutting & Method**, it is added to the **Models** section. There click its name, then on the right panel, click **Facet Marking**.
  - Open your DMC in HP Carbon and then click the **Facet Marking** button on the right panel. The file can be opened by:
    - Drag and drop your DMC to the HP Carbon window.
    - In HP Carbon, select File > Open, navigate to your folder, then start typing the name of your file. As soon as it is suggested, select the file and click **Open**.
- You can **change something in the facet marking** of your DMC sample. To do this, perform the steps:
  - Open DMC and its facet marking as described above.
  - Make changes to the facet marking.
  - Click **Export Sample**, specify a name for your changes version, and then click **Save**.
  - Add a new version of the sample to the system, remove the old one.

## Industrial Object Models - Build and Facet Marking Improvement

A building of industrial object models (cubes, cuboids, trapezoids, truncated cylinders) is improved.

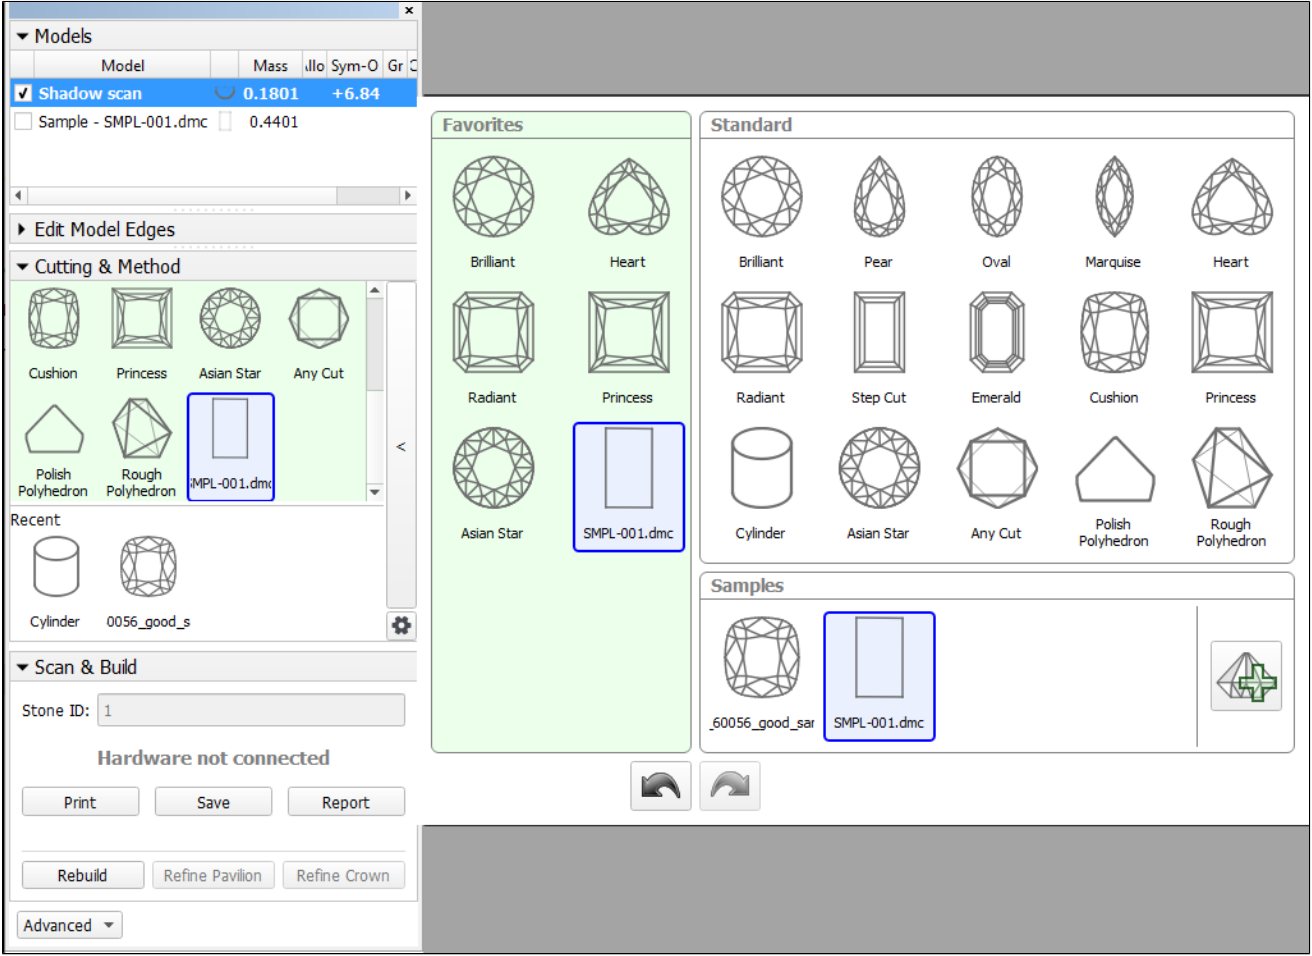

Was	Now
-----	-----

For such models, it is also necessary to apply a facet marking from your sample.

To build a good model for your simple object and automatically apply a facet marking from your sample to it:

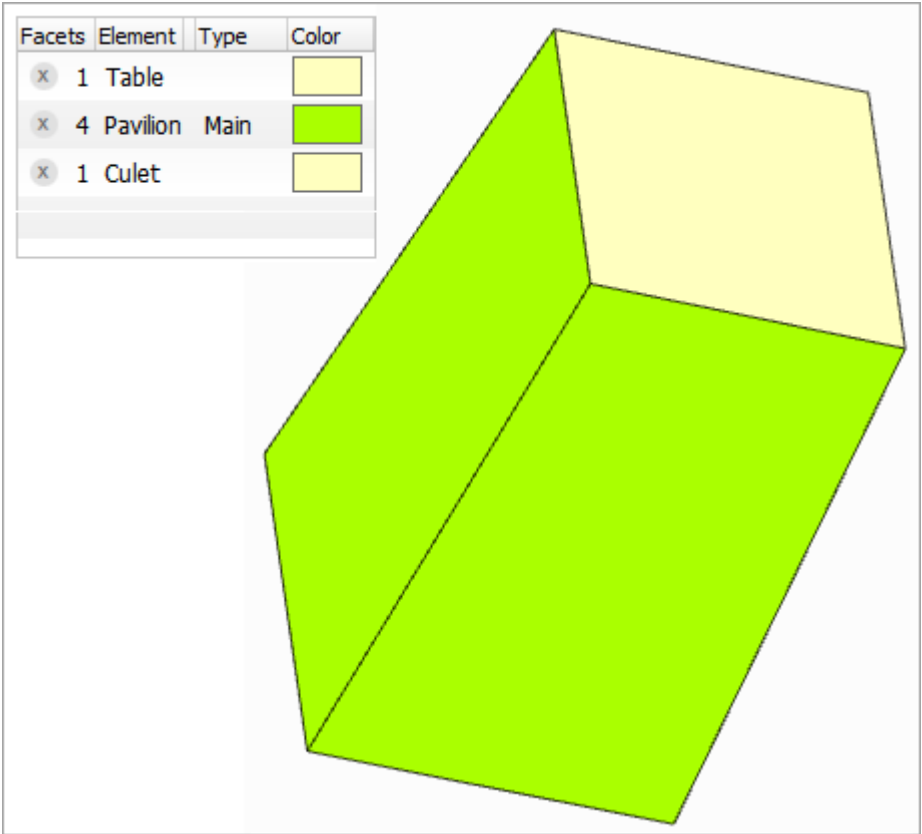

1. Prepare your DMC sample with the appropriate facet marking.
2. Use the Scan mode.

3. In the **Cutting & Method** section, add your sample to the list.
4. Select your sample as a cutting. The system will automatically set the optimal method.
5. Start scanning.

The model of your object is built using one of the improved methods and added to the **Models** section. Its facet marking is automatically taken from your sample.

Trapezoid Workflow

Now you can use the system to quickly obtain important information ( ***report*** ) about your trapezoid-like objects:

What is improved and added to the system and for what?

Type of Update	Feature	Description	Why that was not enough?
New	<b>HTML illustrated report for trapezoid</b>  Described in this Release Notes in <a href="#">HTML Illustrated for Trapezoid</a>	Gives you all the important parameters and pictures of your trapezoid model.	Before running the report, you need a good model with the appropriate facet marking.
Improved	<b>Method of building the trapezoid-like models during the scanning</b>  Described in this Release Notes in <a href="#">Industrial Object Models - Build and Facet Marking Improvement</a>	The methods used for building trapezoid-like models are improved: you do not obtain unnecessary extra facets any more, the model is more precise.	Problem 1: you need to think about which method to select.  Problem 2: even the good model needs an appropriate facet marking - previously scans did not obtain facet marking automatically.
New	When scanning/rebuilding using the sample trapezoid: <ul style="list-style-type: none"><li>• <b>automatic selection of method</b></li><li>• <b>automatic transfer of facet marking from sample to scan</b></li></ul> Described in this Release Notes in <a href="#">Scanning - Applying Facet Marking from Sample</a>	If during scanning/rebuild you use your own sample trapezoid as cutting, the appropriate method will be detected by the system automatically, and your good facet marking will be automatically transferred from sample to your scan.	This gives you all except the report - which was given is step 1!

How to work?

1. Use the **Scan** mode.
2. Use the **Cutting & Method** section.
3. Expand the section.
4. Add your sample.
5. If necessary, drag your sample to the **Favorites** list.
6. Select your sample to be used as cutting. The sample will be added to the **Models** section.
7. To check the facet marking of your sample, in the **Models** section, click your sample, then on the right panel, click **Facet Marking**.
  - a. Side facets of your trapezoid should be marked as "Pavilion - Main".
  - b. If you want to modify the facet marking of your sample, in the Facet Marking dialog make your changes, then click **Export Sample** and save as DMC.
  - c. You will need to add a changed version of the sample and then use it (repeat step 2).
  - d. Remove the old sample from the **Samples** list.
8. Run **Scan** or **Rebuild**. Your new scan is added to the **Models** section.
9. With your new scan selected, on the right panel, click **Polish Report**, go to **Open HTML**, then select "Illustrated report for trapezoid" and **Make Report**.

Polish Report Templates

HTML Illustrated for Trapezoid

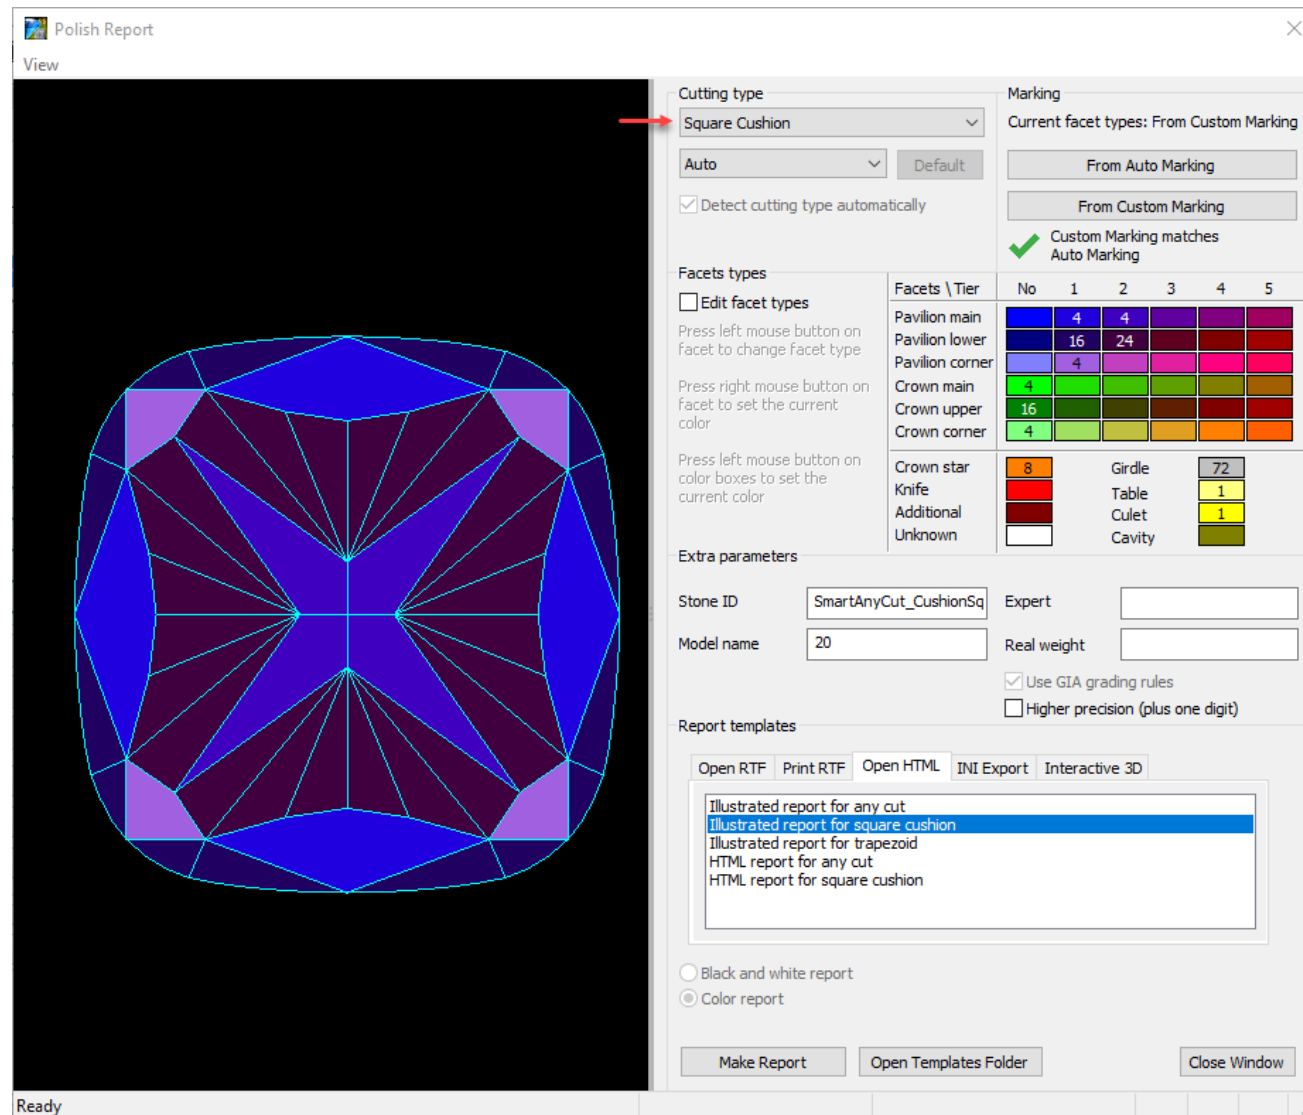

The new template for Polish Report is added - HTML Illustrated for Trapezoid.

This template is an essential part of the [Trapezoid Workflow](#).

### Square Cushion - Cutting Type Support and Reports

Now in Polish Report, the **Cutting Type** list includes "Square Cushion".

The following report templates are added for this cutting type:

- HTML
  - Illustrated report for square cushion
  - HTML report for square cushion
- I3D

Octonus

Also, the Standard Report for Square Cushion is updated correspondingly.

## Comparative I3D Mini View - Distance from Reference/Current

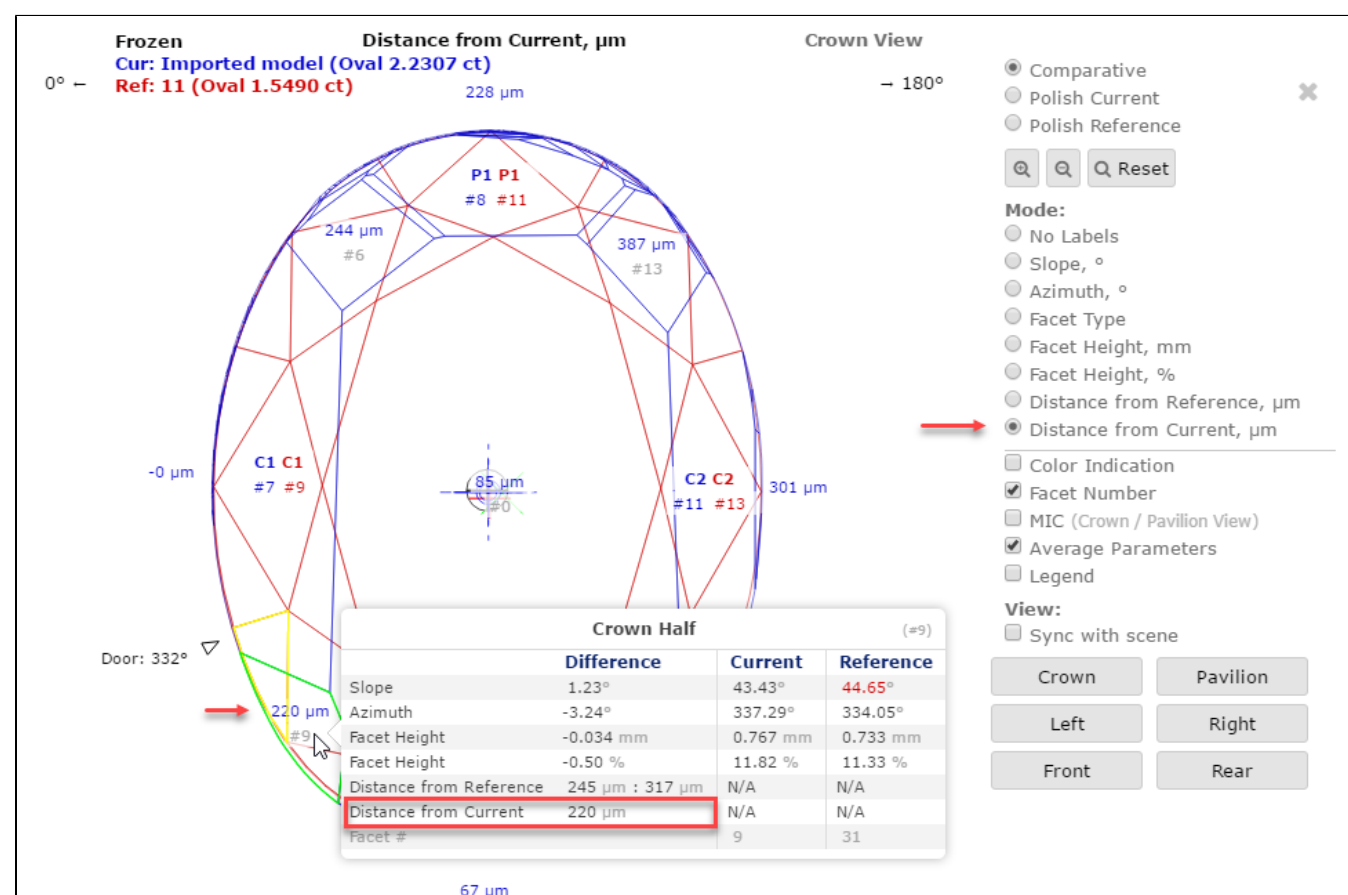

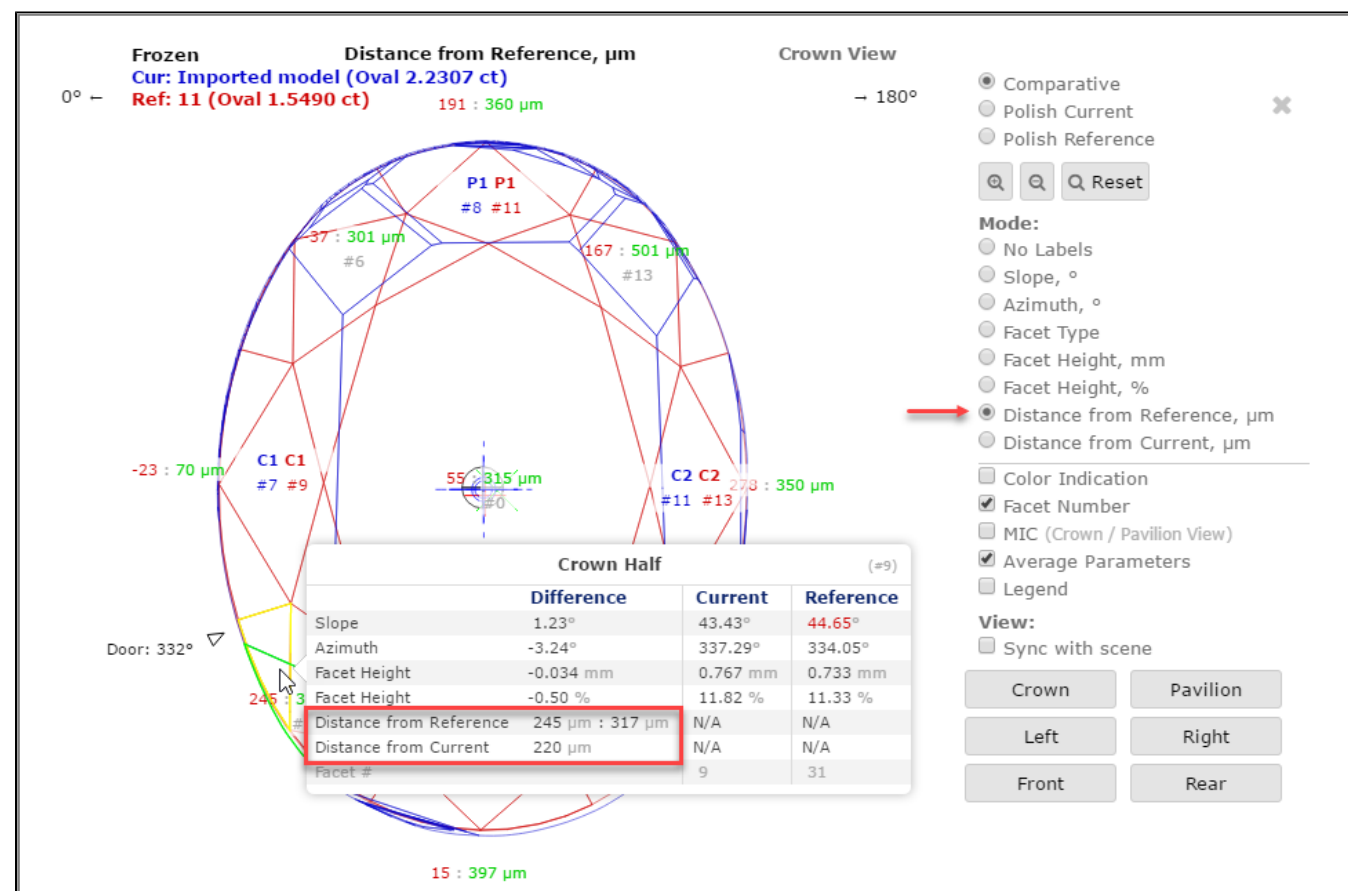

For the [Comparative I3D Mini View](#), two new modes are added:

- Distance from Reference,  $\mu\text{m}$
- Distance from Current,  $\mu\text{m}$

Distance from Reference, $\mu\text{m}$	Distance from Current, $\mu\text{m}$
--	--------------------------------------

Here is an example:

## New Smart Recut Parameters

The new parameter is added to the appraisers used by the Smart Recut algorithms.

SquareDeviation Tolerance

 This parameter is applicable to the following cuts: AnyCut.

The parameter is used in the same way as the [Square Deviation](#) of the Oval cut. Unlike **Square Deviation**, the **SquareDeviationTolerance** (used by Smart Recut only) is set via presets and limits not the value of the parameter, but its deviation from the value of the starting model.

Calculation

The parameter is calculated in the same way as the [Square Deviation](#) of the Oval cut.

Usage and Examples

Here is an example of how the parameter affects a girdle shape and mass:

[117\\_SM\\_10137\\_Square DeviationTolerance.ox2z](#)

# G1 Galahad

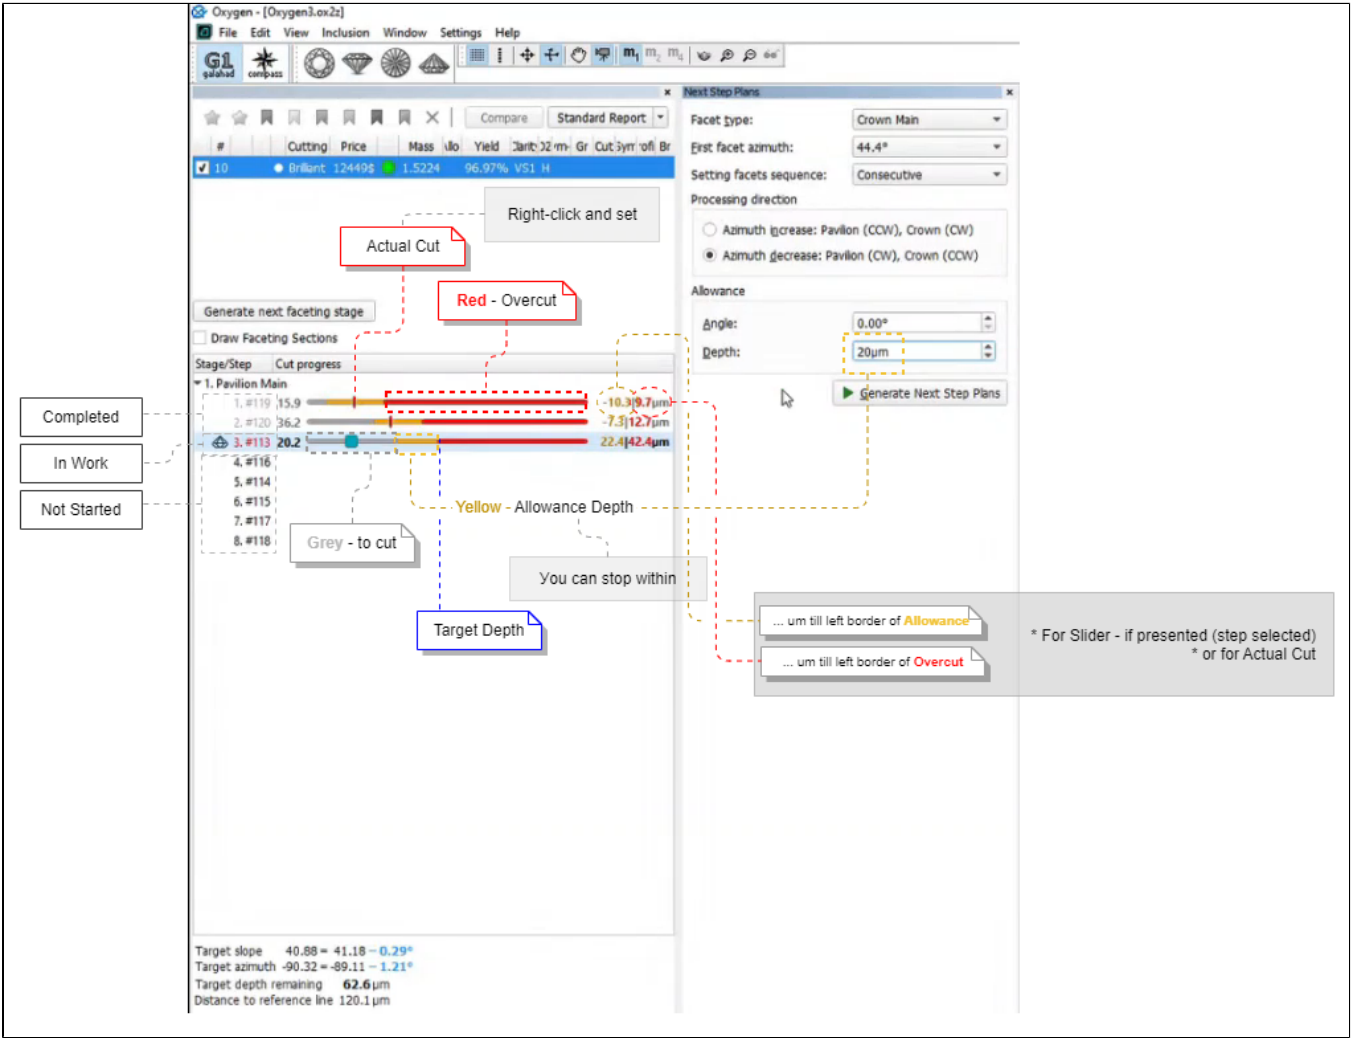

## New Features

For the **G1 Galahad** mode, the new features were added. As this functionality is shared with the Galahad Compass product, see details in the Galahad Compass documentation:

- Release notes [2020.10.21 - Carbon Compass 1.1.13](#) (public)
- Release notes for the [currently developed](#) Galahad Compass release (internal)

Here is a brief overview of what is new:

- Workflow improvements
  - Actual Cut and 4 Colors for Steps
  - Order of Work - Stages and Steps
  - Actual Cut Model
  - Protection of Overcut Area ("lock" icon)

## Slope Allowance Parameter

In the **Next Step Plans** panel, the **Allowance** section, the **Angle** parameter is renamed to **Slope**. The usage of the parameter is temporarily blocked (next step calculation does not consider this parameter) due to technical reasons (planned to be restored in the upcoming releases).

Was	Now
-----	-----

Next Step Plans

Facet type: Crown Main
First facet azimuth: 0.4°
Setting facets sequence: Consecutive
Processing direction

☒ Azimuth increase: Pavilion (CCW), Crown (CW)
☐ Azimuth decrease: Pavilion (CW), Crown (CCW)

Allowance

Angle: 0.00°
Depth: 0,0µm

Next Step Plans

Facet type: Crown Half
First facet azimuth: 304.5°
Setting facets sequence: Consecutive
Processing direction

☒ Azimuth increase: Pavilion (CCW), Crown (CW)
☐ Azimuth decrease: Pavilion (CW), Crown (CCW)

Allowance

Angle: 0.00°
Depth: 0.0µm

## DZ Color Estimation - New Approach and Progress Bar

Previously for [DZ Color Estimation](#) , the calculation of Table Color was performed **after** the Pavilion Color for all the solutions - the process could take time but the progress was not anyhow displayed within the system. This caused the cases when the [export to Cutwise](#) could have been started before the calculation is finished thus the data uploaded to Cutwise did not contain the Table Color information. Now the Pavilion Color and Table Color are calculated together for each solution and the entire progress is indicated:

[illegible]

This approach guarantees that during export to Cutwise all the solutions will be exported with information about both Pavilion and Table Colors.

Polish RTF Reports - Views without Invisible Edges with Rotation

In the Polish RTF Full Report, there are Pavilion and Crown views without indication of invisible edges (PAVILION\_VIEW and CROWN\_VIEW bookmarks):

	
Pavilion view without indication of invisible edges	Crown view without indication of invisible edges

Now you can change the rotation of the model presented on these images. To do this:

- 1. In the template, locate PAVILION\_VIEW or CROWN\_VIEW bookmark.
- 2. Replace bookmarked text as follows:

Was	Now	Comment
-----	-----	---------

5. At the very bottom of the page, in the small font string, at the end of the string but before closing square bracket, put comma then (without space) `PAVILION_VIEW1`.

Overall cut quality / symmetry quality	N/A / N/A
Final grade	N/A
Model building info	N/A

<b>Color</b>	
<b>Clarity</b>	
<b>Polish</b>

Crown height	Pavilion height	Table	Culet	Girdle height			
				Bessel	Bone	Valley	
N/A mm	N/A mm	N/A mm	N/A mm	N/A mm	N/A mm	N/A mm	
<p>[Width=74,Height=74,PictureID=DRAW_DIA MOND-PavilionView-1,Cutlet=6,Parameter= =0,FontSize=0,X=22.5,Y=90,]</p>							

7. Save changed report template.

 **Note**

If you want to save changes as a separate template, use **Save As** - before saving, in the small font string, change the `VisibleName` parameter.

The resulting report will look like:

-------	--------	-------	-------	--------	--------------	-------------

- Standard, automatic: via the **Upload to Cutwise** button in HP Carbon
- Manual: uploading models/reports directly (for example, as DMC files, including the ones obtained from the old HP Oxygen) via uploader

It is important to remember, that if you use the **Upload to Cutwise** function in HP Carbon, you ***should not use the manual approach*** for the same data, because after **Upload to Cutwise** is used if you try to manually upload the same models/reports, you ***will not see the new data*** in Cutwise - the one previously uploaded from the system with the **Upload to Cutwise** function will stay unchanged.

## New Logo and Icons

HP Carbon now has the new logo:

## Fixed Problems and Improvements

The following fixes for the known problems and improvements are implemented:

- For Comparative I3D Mini View, synchronization with the Scene did not work in some cases - now this is fixed.

 Models in Comparative Reports are aligned by the Current model now and in particular in Comparative I3D Mini View. Due to the modification of models' alignment calculation results in Comparative Reports is changed.

- Facet Marking transfer for some cuttings is improved.
- To improve Smart Recut allocation for the big (5ct+) round stones, to the "MyRound | GIA Facetware + MyRound" appraiser, the "MyRound\_ H&A 5ct+" profile, the appropriate presets are added.
- Minor further improvements are made for the Smart Recut mechanism of [creating girdle extra facets](#). Read about this *mechanism improvement* in the previous release on the [2020-08-11 - HP Carbon 1.0.0](#) page.
- For the Princess cutting, the model building is improved - the Crown is now built better.
- For the Smart Recut, when working with *multi-diamond solutions from rough* , described for the previous release ([2020-08-11 - HP Carbon 1.0.0](#) page), some additional improvements are implemented:
  - Facet marking is copied along with the diamonds copied during Smart Recut
  - A bunch of Smart Recut attributes is copied along with the diamonds
- Cutwise integration:
  - The [Upload to Cutwise](#) feature is now available on all HASP keys.
  - A new basis position is supported - "Culet" (= "Heart").
  - Solutions with cutting names in user locale were not uploaded to Cutwise - now this is fixed.
- Bug with the episodic crash of the system during file opening is fixed.
- Bug with the crash of the system during DZ Color calculation is fixed.
- A rare bug when some system settings were reset to default values is fixed.
- Autosave did not work - now this is fixed.
- During the import of scanned ASCII, an error occurred (displayed on the picture below) caused by too strict limitations. Now limitations are eased to avoid error and allow using all scanned ASCII models.

- The Rough recognition algorithm is improved.

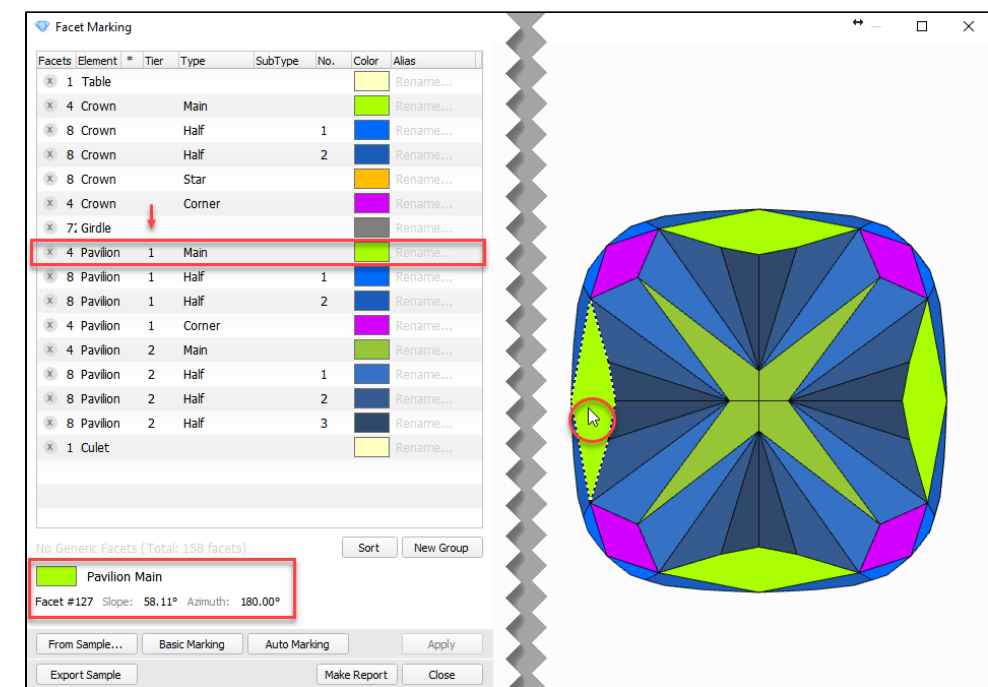

Was	Now
-----	-----

- A system crash on running Smart Recut with AnyCut composite appraiser for some specific cuttings is fixed.
- Fixed bug with wrong DZ Color Estimation of Main Scan if a project had several scanned or imported models. This issue was not affecting DZ estimation of solutions.
- The wrong model rebuild for the Oval cutting is fixed.
- In the Illustrated report for Cushion, on the image, some facet angles were not displayed - now this is fixed, all angles are presented.

- Label printing is improved to work correctly with different page sizes.
- The problem leading to an episodic crash of the Smart Normalize algorithm is solved.
- The problem with Comparative 13D Mini View freezing in some cases is solved.
- The system rare crash during Cutwise upload is fixed.
- In the 13D Report and View, for the Sakura cutting, the Table parameters were mistakenly displayed as "0.00" while they are not calculated at all - now they are displayed as "N/A".
- Smart Recut crashed the system if Solutions Report was previously opened - now this problem is fixed.
- The **Facet Marking** dialog:

- When pointing a facet, "Tier" information was not displayed in the facet info block for "Tier 1" - now this is fixed.

- For the "Cylinder" cutting, the dialog did not open (the error was displayed instead) - now this is fixed.
