

# How to activate bold font in the DM software GUI

Try the following if the **DM** GUI font size is too small for the current display resolution (for example, when you use **Ultra HD 4K**), or the GUI text is difficult to read in the interlaced stereo mode.

Please change the **FontWeight** key in the **Style** section on the "**bold**" value (or add if it doesn't exist) in the **dmconfig.xml** configuration file (it's located in the root folder of the application).

Example of the configuration:

dmconfig.xml

```
<config version="1.0">
  <section name="Hardware">
    ...
  </section>

  <!-- Add this section if it doesn't exist -->
  <section name="Style">
    <!-- Key to specify the font weight -->
    <key name="FontWeight" value="bold" /> <!-- Possible values: normal (default value) / bold -->
  </section>
</config>
```
